 Open Liberty Helm Chart

Introduction

Open Liberty provides developers with proven Java EE 7 technology and the latest Eclipse MicroProfile™ capabilities for building microservices. Building cloud-native apps and microservices has never been more efficient, since you only have to run what you need. Our goal is to give you just enough to get the job done without getting in your way.

Resources Required

System resources

- CPU Requested : 500m (500 millicpu)
- Memory Requested : 512Mi (~ 537 MB)

Storage

A persistent volume is required, if you plan on using the transaction service within Liberty. The `server.xml` Liberty configuration file must be configured to place the transaction log on this volume so that it persists, if the server fails and restarts.

Select Namespace Above

Parameters

Welcome, let's get started.

The IBM® Cloud Pak for Multicloud Management, running on Red Hat® OpenShift®, provides consistent visibility, governance, and automation from on premises to the edge. Enterprises gain capabilities such as multicluster management, event management, application management and infrastructure management. Enterprises can use this IBM Cloud Pak to help increase operational efficiency that is driven by intelligent data, analysis, and predictive golden signals, and gain built-in support for their compliance management.

Define and deploy your own applications

Use policy based deployment to automate across environments.

[Docs](#)

Be notified when problems occur

Set up procedures and automation.

[Docs](#)

Monitor your application performance

As well as your infrastructure, including components in and outside Kubernetes.

[Docs](#)

Automate cloud provisioning

Customize how you want to provision clusters and infrastructure.
